

Diversity, Equity and Inclusion (DEI) in the Electronic Health Record

Capturing the Lived Experiences of Patients

Kenrick D. Cato,
PhD, RN
Assistant Professor
School of Nursing
Columbia University

Kevin B. Johnson,
MD, MS
Professor & Chair
Dept. of Biomedical Informatics
Vanderbilt University

Amanda J. Moy,
MPH, MA
NLM Pre-doctoral Trainee
Dept. of Biomedical Informatics
Columbia University

Jessica M. Schwartz,
MPhil, BSN, RN
NINR Pre-doctoral Trainee
School of Nursing
Columbia University

Catherine Thomsen,
MPH
Program Director
Zero Breast Cancer

The 25X5 DEI Taskforce

Vision

How **different** would
the documentation be
if it were written from the
patient's perspective?

1

Structure

2

Process

3

Outcomes

1 Structure

1 Structure: Culture

- Ivory tower
- Clinical training and education

1 Structure: People

Personal characteristics that help or hinder optimal usage of health care:

- **Background, personal history, historic trauma, e.g. clinicians and patients same race/ethnicity**
- **Differences in education, culture, language, literacy levels**
- **Familiarity with and ability to navigate through systems**
- **Person resources (financial, social, geographic location) e.g. “VIP” patients**
- **Access to healthcare, healthy food, housing**

Structure: Organizational

- Organizational policies and procedures
- Front office role (administration, triage)
- e.g. Ebola “did you travel lately?”

1 Structure: Technology

- **Current structure resonates with the people who create and use the documentation**
- **Different people express their data differently**
- **Think about how the Eurocentric paradigm influences documentation (i.e., design)**

2 Process

- Who defines the goals of documentation process
- For example, regulatory requirements like meaningful use

Process

- Important patient characteristics (e.g. race, ethnicity, gender identity, sexual orientation cultural heritage) may be documented based on either confidence of the recorder or perceived value to the system
- Information may be screened out if deemed unimportant.

3 Outcomes

- **Patient-centered care components, like preferences, core values, contextual information, shared decision-making preferences may be missing.**

3 Outcomes

- For what purposes do we use our documentation?
- If a document is used in the court of law, who is silenced?

3 Outcomes

- Information is filtered through systems and processes
- Downstream data is biased
- Effect of data collection on data science

**Please remember,
there is a lot that we
don't record that matters
in healthcare.**

**If we recorded the
whole patient visit
would
we fix the problem?**
